

Data Protection Impact Assessment (DPIA)

Controller: Tellter SAS (Operator of Double Counter)

Origin: Doogle and Lens features

Date: May 2025

1. Description of the Processing

Doogle enables authorized moderators to input a Discord User ID and receive a list of other User IDs potentially associated with the same individual, using internal linkage signals from prior verifications. No raw data is displayed. Lens records actions like bans or kicks, storing non-personal data to provide audit trails and improve moderation transparency.

2. Purpose and Legal Basis

The legal basis for both Doogle and Lens is Legitimate Interests (Article 6(1)(f), GDPR). Doogle supports fraud detection and abuse prevention by providing verified moderators with tools to evaluate account linkage. Lens provides a data trail of server-side actions for accountability.

3. Assessment of Necessity and Proportionality

Doogle only uses data already collected from verification activity, and only authorized moderators can access it. No sensitive identifiers (e.g., IPs) are revealed. Lens stores high-level moderation metadata without identifying user information. Both features use only the minimum data necessary and are tightly integrated into Double Counter's moderation tools.

4. Risk Assessment

Risks include potential misuse of association data by Doogle users or inference of identity via Lens. These are mitigated by subscription-only access, non-disclosure of sensitive data, logging of all Doogle lookups, and audit-based access reviews. No decision-making occurs without moderator oversight.

5. Measures to Address Risks

Doogle access is monitored and limited to subscribers. Results exclude personal data and show only correlation scores. Lens does not track user IDs or IP data and is limited to

events. Encryption, logging, opt-out mechanisms, and response workflows for Article 21 objections are in place.

6. Consultation with Stakeholders

Stakeholders are informed via the Privacy Policy and Discord-based support channels. No high risk requiring supervisory authority notification has been identified. Users retain full GDPR rights and can contact the controller with concerns or opt-out requests.

7. Conclusion

The processing associated with Doogle and Lens is necessary, proportionate, and appropriately safeguarded. The features support legitimate interests in moderation and abuse prevention. Risk is low and adequately mitigated in accordance with GDPR requirements.
