

Legitimate Interests Assessment (LIA)

Controller: Tellter SAS (Operator of Double Counter)

Origin: Doogle and Lens features

Date: May 2025

1. Purpose of the Processing

In addition to core verification, Double Counter operates two feature sets with personal data implications: Doogle and Lens. Doogle is a subscription-based tool allowing moderators to search for Discord User ID associations to identify potential alt accounts, based on encrypted matching data already collected during verifications. Lens provides automated tracking of administrative actions like bans, kicks, and mutes, to enhance community oversight without linking to personal identifiers such as usernames or IP addresses.

2. Necessity Test

Doogle is necessary for enhancing moderation capacity in large communities. By providing a similarity-based lookup system tied to technical signals, Doogle enables efficient abuse detection. Lens captures moderation activity to offer transparency and accountability for actions taken by moderators. No alternative provides this transparency without processing event metadata. Both systems are tightly scoped, automated, and restricted to authorized users.

3. Balancing Test

Doogle only returns user ID associations and similarity ratings—no sensitive data is shown. Access is limited to verified subscribers, and users can opt out under GDPR Article 21. Lens does not capture personally identifiable information and focuses on moderation actions only. Given these constraints, the features do not override user rights. Users are notified of this processing in the privacy policy and may object or request data erasure.

4. Safeguards

Doogle results are derived from encrypted records; no raw IPs or device fingerprints are shown. Access is logged and restricted to approved accounts. Lens stores non-identifying moderation actions for server analytics and oversight. All processing is automatic, encrypted, and rights-based access controls are in place.

5. Outcome

Doogle and Lens provide essential tools for server moderation and accountability. The data processed is minimal, well-protected, and justified under the legitimate interest in protecting communities from abuse. These features comply with GDPR's proportionality and necessity principles.
